way in which the absorbed dose is distributed along the path of the radiation. Studies have shown that alpha and neutron radiation cause greater biological damage for a given energy deposition per kg of tissue than gamma radiation does.

biological effects of any radiation increases with the linear energy transfer (LET). In short, the biological damage from high-LET radiation (alpha particles, protons or neutrons) is much greater than that from low-LET radiation (gamma rays).

What is Biological Effects of Radiation - Definition

Four things can happen when radiation enters

a cell: 1. The radiation may pass through without any damage occurring; 2. The radiation may damage the cell, but the cell repairs the damage; 3. The radiation may damage the cell...the damage is not repaired...and the cell replicates itself in the damaged form; 4. The cell dies.

BIOLOGICAL EFFECTS OF IONIZING RADIATION Ionizing radiation in very high levels is known to increase the incidence of cancer, birth anomalies, erythema, and other problems.

When the quantity of

radiation energy deposited in living tissue is high enough, biological damage can occur as a result of chemical bonds being broken and cells being damaged or killed. These effects can result in observable clinical symptoms. The basic unit for measuring absorbed radiation is the rad.

Exposure to very high levels of radiation, such as being close to an atomic blast, can cause acute health effects such as skin burns and acute radiation syndrome ("radiation sickness"). It can also result in long-term health effects such as cancer and cardiovascular disease.
