Dental Anatomy And Tooth Morphology

All facial surfaces of the crown are convex, and the crest of the curvature is located in the cervical third; the lingual surfaces of posterior teeth are convex, and the crest of curvature is located in the middle third; the lingual surfaces of anterior teeth are concave in the middle third; these contours deflect food away from the gingiva and facilitate the function of teeth (Figure 5-13)

5: Clinical Oral Structures, Dental Anatomy, and Root ...

Anterior teeth include the teeth toward the front of the mouth, including the central incisors, the lateral incisors, and the canines, while posterior teeth, or the teeth toward the back of the mouth, include the premolars and molars . The difference between these types of teeth will be described in the next section.

Tooth Morphology Overview | IntechOpen

Dental anatomy is a field of anatomy dedicated to the study of human tooth structures. The development, appearance, and classification of teeth fall within its purview. Tooth formation begins before birth, and the teeth's eventual morphology is dictated during this time. Dental anatomy is also a taxonomical science: it is concerned with the naming of teeth and the structures of which they are made, this information serving a practical purpose in dental treatment. Usually, there are 20 primary te

Dental Anatomy Tooth Morphology Questions and Study Guide ...

The Central and lateral Incisors are the teeth designed to cut or shear our food while our cuspids also known as Canines are geared for grabbing and tearing food. The posterior teeth have a wider occlusal table and not as sharp cusps which are designed to crush and grind our food making food easier to digest.
