Dynamic balancing is the method of measuring the imbalance with sensitive electronic equipment while a body rotates rapidly. This process also tests vibration by adding or removing weight from the rotating body to align the effective mass center with the axis of rotation.

The balancing of rotating bodies is important to avoid vibration. In heavy industrial machines such as gas turbines and electric generators, vibration can cause catastrophic failure, as well as noise and discomfort. In the case of a narrow wheel, balancing simply involves moving the center of gravity to the centre of rotation. For a system to be in
