Exponential Growth and Decay. Exponential word problems almost always work off the growth / decay formula, $A = Pe^{rt}$, where "A" is the ending amount of whatever you're dealing with (money, bacteria growing in a petri dish, radioactive decay of an element highlighting your X-ray), "P" is the beginning amount of that same "whatever", "r" is the growth or decay rate, and "t" is time.

Half-life problems deal with exponential decays that halve for every time period. For example, if we start out with 20 grams, after the next time period, we'd have 10, then 5, and so on. For these problems, the base (decay factor) of the exponential equation is .5.
