## **The Ear Hearing And Balance**

There are three components to the ear: the outer ear, the middle ear and the inner ear. All three are involved in hearing but only the inner ear is responsible for balance. The outer ear is composed of the pinna, or ear lobe, and the external auditory canal. Both structures funnel sound waves towards the ear drum or tympanic membrane allowing it to vibrate.

The ear is one of the sensory organs that help us to hear. An interesting point to note is that the ear not only helps in hearing but also helps us to maintain the balance and equilibrium of our body. Without the ear, we would not be able to balance our body with respect to the gravitational pull of the earth.

## **The Ear: Hearing and Balance Flashcards | Quizlet**

Our balance system relies on the labyrinth, a maze of bone and tissue located in the inner ear. It holds the semicircular canals, the otolithic organs, and the cochlea. While the cochlea is used for hearing, the canals are used for balance. These look like three circular loops, and each is responsible for sensing a different type of movement.

Labyrinthitis is an inner ear disorder. The two vestibular nerves in your inner ear send your brain information about your spatial navigation and balance control. When one of these nerves becomes inflamed, it creates a condition known as labyrinthitis.

### **Ear and Hearing Problems - Balance Issues | Proliance ...**

The ear is the organ of hearing and, in mammals, balance. In mammals, the ear is usually described as having three parts—the outer ear, the middle ear and the inner ear. The outer ear consists of the pinna and the ear canal. Since the outer ear is the only visible portion of the ear in most animals, the word "ear" often refers to the external part alone.
