The directional couplers are inherently assumed as four-port devices, which consisted of two transmission lines that are electromagnetically coupled to each other. The first port is named as input, and the second one as output or transmitted, the third one as sampling or coupled and the fourth one as isolated or terminated.

Multi-Hole Waveguide Directional Couplers

Waveguide coupler's coupled output port is farthest away from the input port. Conversely, microstrip or stripline coupled line's coupled output port is closest to the input port. Any system level schematic symbol should rely on no assumptions in the reader's mind, and should always show an arrow or words depicting coupling direction. Mar 26, 2005

Couplers For Waveguide RF Systems These waveguide directional couplers are very similar to coax couplers and are a basic microwave device used in most microwave systems, test sets and applications for monitoring RF power. Waveguide directional couplers allow for monitoring of power without altering the characteristics of the transmission line.

One method to make waveguide or fiber couplers is to use straight sections of the guides where the evanescent modes of one guide overlap with the modes of a second guide, eg, a directional coupler. The light from one guide slowly transfers back and forth between the guides.

Evanescent waveguide couplers - Lumerical Support

Directional couplers can be realized in microstrip, stripline, coax and waveguide. They are used for sampling a signal, sometimes both the incident and reflected waves (this application is called a reflectometer, which is an important part of a network analyzer). Directional couplers generally use the distributed properties of microwave circuits.

Can I design coupler in HFSS? - ResearchGate

A directional coupler designed to split power equally between two ports is called a hybrid coupler. Directional couplers are most frequently constructed from two coupled transmission lines set close enough together such that energy passing through one is coupled to the other.

Directional couplers are one of the more common passive components added to a system after a certain design stage, usually to perform monitoring or testing purposes. Companies with broad product lines, such as Mini-Circuits, stock a variety of couplers for handling power levels as high as 250 W at frequencies from 5 kHz to 18 GHz.
